UNREAD MARK REPLICATION BOUNCEBACK PREVENTION

Abstract of the Invention

Under the present invention, a method, system, and program product for preventing an unread activity from being sent back (i.e., bounced-back) to its originating server during a replication operation are provided. The method includes: storing an identification of an originating server of a replicated unread activity in an unread log of a receiving server; and during a subsequent replication process initiated by the receiving server, preventing replication of the unread activity back to the originating server.
